SwiftLog Logistics

Business Review: How the supply chain performed, 1 Jan to 8 Sep 2026

Prepared by Okoro Joseph Ifeanyichukwu | AnalystLab Africa Experience Lab, Week 5 | Based on 12 SwiftLog data files, analysed in Power BI

1. The short version

SwiftLog sold about **₦14.44M** worth of goods (counting every order that was not cancelled). Customers are loyal: **almost 9 in 10** of the people who buy come back and buy again. The big problem is what happens **after** an order is placed. Only **1 in 3 orders has been delivered**, 1 in 3 was cancelled (about ₦7.23M of orders lost) and 1 in 3 is still waiting (about ₦7.33M). Even among delivered orders, **only 37 in 100 arrive on time**, they are late by 3.5 days on average, and about 1 in 10 is sent back. Stock is also badly spread out: two warehouses are almost full while the company sells only about 5% of the goods it holds. We could not judge suppliers, because the data does not say which supplier provides which product.

Sales	**₦14.44M**	Orders placed	**5,000**	Average value of an order	**₦4.28K**
Delivered on time	**37.21%**	Average days late	**3.52 days**	Delivered orders sent back	**9.53%**
Customers who bought	**959 of 1,000**	Bought again	**87.7%**	Goods in stock	**1.01M units**

Plain-English guide. *On time = delivered within 2 days of the promised date. Bought again = share of buying customers with two or more orders. How full = stock held compared with an assumed capacity of 80,000 units per warehouse. Share of stock sold = units sold divided by units in stock.*

2. Ten questions the business asked, answered simply

1. Which month sold the most, and is it growing?

Sales crept up from ₦1.63M in January to ₦1.84M in May, dipped to ₦1.54M in July, then **peaked in August at ₦2.03M**, about 16% above the January-June average. September looks low (₦0.38M) only because our data stops on 8 September.

Where to see it: Executive Dashboard: Revenue Trend by Month.

2. What sells best?

Fashion brings in the most money (₦5.41M, 37.5% of sales), then Food (₦4.74M) and Electronics (₦4.29M). The product sold most often is P132 (347 units), but P085 earns the most money (₦143K). No single product dominates: the top 10 together make up only 8.4% of sales.

Where to see it: Supplier & Product page.

3. Where do sales come from? Do we depend on a few customers?

Kano gives the most (₦3.87M), then Lagos (₦3.65M), Ibadan (₦3.50M) and Abuja (₦3.42M), so the four cities are close. The 10 biggest customers account for only 3.3% of sales, so losing one customer would not hurt much.

Where to see it: Customer Analytics page.

4. Do customers come back? Are we gaining new ones?

Yes, they come back. Of 959 customers who bought, 841 bought more than once (**87.7%**). The weak spot is new customers: we gained 307 new buyers in January but only about 30 a month by August.

Where to see it: Customer Analytics page: Order Frequency and Customer Growth.

Figure 2. Customer Analytics page.

5. How many orders actually get completed?

Only **33.2%** of orders are delivered (1,658). Another 34.3% are still pending (1,716) and 32.5% were cancelled (1,626). In money terms, about ₦7.1M has been delivered, ₦7.3M is waiting and ₦7.2M was cancelled.

Where to see it: Executive Dashboard: Monthly Orders by Status.

6. Are deliveries on time?

Mostly not. Only **37.21%** of delivered orders arrive on time. The other 1,041 are late by an average of 3.5 days. The lateness is spread evenly across 3 to 7 days, so it is a regular problem and not a few bad days. A customer can expect roughly 6 to 7 days in total.

Where to see it: Shipment & Delivery page.

7. Where are deliveries worst?

Kano is weakest: only 32.87% on time (292 of 435 late). Ibadan is best at 40.89%. Among warehouses, W13, W06 and W08 are the slowest (about 30-31% on time), and W15 the best (41.8%).

Where to see it: Shipment & Delivery page: On-Time Rate by City.

8. Why do customers send goods back? Is lateness the cause?

158 delivered orders (**9.53%**) were returned. The reasons given were late delivery (63), damaged goods (53) and wrong item (46). Surprisingly, late orders are returned no more often than on-time ones (about 9.5% each), so lateness is not clearly the main driver. Abuja has the highest return rate (11.5%).

Where to see it: Executive Dashboard: Returns by Reason.

9. Which warehouses are under pressure?

Using an assumed capacity of 80,000 units, **W12 (97% full) and W02 (91% full)** are nearly full, while W01 (71%) has plenty of room. Lagos holds 53% of all stock. 142 product lines are almost out (under 50 units) and 3 are completely out. Overall the company holds 1.01M units but sold only 55,390, so most stock sits unsold.

Where to see it: Inventory & Warehouse page.

10. Which suppliers perform best?

We cannot say. The supplier list (150 suppliers) is not linked to any product, order or return. We chose to say so openly instead of guessing. Recommendation 13 shows how to fix it.

3. What we recommend

#	What to do	Why (what the dashboard shows)	How and target	Priority
1	**Cut cancelled orders**	1 in 3 orders (1,626, worth ₦7.23M) is cancelled.	Ask customers why they cancel; confirm stock and payment before accepting an order. Aim for under 20%.	High
2	**Clear the waiting orders**	1,716 orders worth ₦7.33M are still pending.	Review waiting orders every day and dispatch within 48 hours.	High
3	**Deliver on time more often**	Only 37 in 100 orders arrive on time.	Agree delivery deadlines with couriers and track on-time deliveries every week. Aim for 60%.	High
4	**Fix delivery in Kano**	Kano is on time only 33% of the time.	Add courier capacity or a local pickup point in Kano.	High
5	**Fix the three slowest warehouses**	W13, W06 and W08 are on time only about 30% of the time.	Review their process and copy what W15 (42%) does.	Medium
6	**Promise realistic delivery dates**	Real delivery takes about 6 to 7 days.	Tell customers 6 to 7 days until performance improves, and warn them early about delays.	Medium
7	**Even out the stock**	W12 and W02 are over 90% full; W01 is 71%.	Move slow stock from the full warehouses to W01 and W15.	Medium
8	**Refill the almost-empty items**	142 product lines have under 50 units; 3 have none.	Set a refill level of 50 units and restock zero-stock items first.	High
9	**Buy less of what does not sell**	The company holds 1.01M units but sold 55,390.	Match purchasing to sales and discount slow items.	Medium
10	**Reduce returns**	About 1 in 10 delivered orders comes back; Abuja 11.5%.	Check items before packing and improve packaging, starting with Abuja.	Medium
11	**Win new customers**	New customers dropped from 307 a month to about 30.	Run referral and first-order offers; keep rewarding repeat buyers.	Medium
12	**Prepare for busy months**	August earned 16% more than average; Fashion is 37.5% of sales.	Build stock and delivery capacity before busy months; keep Fashion in stock.	Medium
13	**Collect the missing data**	No supplier link, no stock date, no delivery dates.	Record the supplier for every product, a date on stock counts, and dispatch and delivery dates.	High

4. How we got these numbers

Sales = quantity x price for every order that was not cancelled (pending orders included). Delivery and return figures only use delivered orders. The 80,000-unit warehouse capacity and the 3-day standard delivery time are assumptions that can be changed in the dashboard. Stock figures are a single snapshot with no date, September covers only 1 to 8 September, and the data looks computer-generated, so treat patterns as a guide, not a prediction. The README lists every definition and cleaning step.
